Assignment 1
STATS 101

October 1, 2019

Please complete the following problems.

Remember:

- do not rename external files or edit them in any way.

- do not use global paths in your script. Instead, use `setwd()` interactively in the console, but do not include this code in your submission.

- do not destroy or overwrite any variables in your program.

It might help to clear all the objects from your workspace, and then `source` your file before you submit it. This will often uncover bugs.

1

Make a vector called `myVector` and have it store the integers $1, 2, 3$

2

Make a string called `myString` and have it store your name.

3

Read in the data set called `data.csv` and store the data frame as `myDataFrame`.
